
Name

rdautocheck — Display metadata for coherent Rivendell backups

Synopsis

```
rdautocheck {mount-pt1} [mount-pt2] [...]
```

Description

rdautocheck(8) is a command-line tool used for displaying the metadata for one or more coherent backups (database+audiostore) of the Rivendell Radio Automation System generated by **rdautoback**(8).

rdautocheck(8) will attempt to mount the filesystem corresponding to each mount point specified in its invocation and, if successful, print the contents of the `INFO.txt` file in the mounted filesystem to standard output, following which the volume will be unmounted.
